Overview

Application that extracts the complete list of members of an ArcGIS Enterprise / Portal and saves it to CSV and Excel (.xlsx).

It was built starting from the original script (cod.txt, based on the arcgis library) and rewritten to talk directly to the Portal REST API using only the Python standard library — so it does not depend on the heavy arcgis package.

What it does

1. Authenticates against the portal and obtains a temporary token (/sharing/rest/generateToken).
2. Pages through all members (/sharing/rest/portals/self/users).
3. Optionally, for each member, reads the groups it belongs to (/sharing/rest/community/users/{user}).
4. Writes the result to portal_users.csv and portal_users.xlsx.

Generated columns

Column	Description
Username	The user name
LicenseType	License type (e.g. GISProfessionalAdvUT, viewerUT)
FullName	Full name
Email	Email address
Role	Role (e.g. org_user, org_admin)
Level	Account level (1 / 2)
Disabled	Account disabled? (Yes / No)
Provider	Identity provider (e.g. arcgis)
Created	Account creation date (YYYY-MM-DD HH:MM:SS)
LastLogin	Last sign-in (Never if the user never logged in)
Modified	Date the account was last modified
Groups	Groups the member belongs to (separated by ;)

The .xlsx file additionally has: bold header, frozen header row (freeze pane), auto-filter on columns and auto-adjusted column widths.

Requirements

- Windows (tested on Windows 11).
- For the executable: nothing — ExportPortalUsers.exe runs standalone, without Python installed.
- For running from source: Python 3.9+ (tested on 3.14.5) and the openpyxl package (installed automatically by start.bat).
- Network access to the portal: <https://gis.ancpi.ro/portal>.

- A portal account with permission to list the organization's members.

How to run

At startup, the application interactively asks for four pieces of information (press Enter at any prompt to keep the default value shown in brackets):

5. Portal GIS URL – e.g. `https://gis.ancpi.ro/portal`
6. User (username) – e.g. `ginu.popescu`
7. Password – not shown while typing, kept in memory only
8. Save path for the CSV and XLSX files

There are three ways to launch it, in order of simplicity.

Option A – Executable (recommended)

Double-click `dist\ExportPortalUsers.exe`. The application asks the four questions above in the console, then generates the files. No Python installation required.

Option B – start.bat launcher

Double-click `start.bat`. It detects Python, installs `openpyxl` automatically if missing, and starts the application.

Option C – Directly from source

```
cd C:\#_LUCRU\Aplicatii\ExportPortalUsers
python export_portal_users.py
```

Password – how it is supplied

The password is never stored in code or in files.

- By default: the application asks for it interactively at run time. The entered text is hidden and kept only in memory for the duration of the run.
- Optional (automated runs): if the `PORTAL_PASSWORD` environment variable is set, it is used without prompting.

```
$env:PORTAL_PASSWORD = "password" # current session only (PowerShell)
```

Security note: the interactive prompt (`getpass`) reads directly from the console, so it must be run in a real terminal, not through a pipe or input redirection.

Configuration

The portal URL, the user and the save path are requested interactively at run time. The values in the table are only the defaults (proposed at the prompt) and can be changed at the top of `export_portal_users.py`:

Variable	Default	Purpose
DEFAULT_PORTAL_URL	https://gis.ancpi.ro/portal	Portal URL proposed at the prompt
DEFAULT_USERNAME	ginu.popescu	User proposed at the prompt
DEFAULT_OUTPUT_PATH	...\ExportPortalUsers	Save path proposed at the prompt
INCLUDE_GROUPS	True	Include the Groups column (one extra REST call per member)
WRITE_XLSX	True	Also write the Excel file
FILTER_LIKE_ORIGINAL	False	True = only viewer licenses, exclude esri_* accounts
INSECURE_SSL	False	True = skip TLS certificate verification
PAGE_SIZE	100	Members per REST call

At the prompt, press Enter to accept the default. INCLUDE_GROUPS = False speeds up the run significantly (removes one REST call per member).

Folder structure

```
ExportPortalUsers\
├─ dist\
│   └─ ExportPortalUsers.exe    the standalone executable (with icon)
├─ export_portal_users.py      the main script
├─ start.bat                   launcher (Python + auto-install openpyxl)
├─ make_icon.py                the icon generator
├─ app.ico                     the application icon
├─ cod.txt                     the original script (starting point)
├─ README.md                   documentation (Romanian)
├─ README_EN.md                documentation (English)
├─ portal_users.csv            CSV output
└─ portal_users.xlsx           Excel output
```

Rebuilding the executable

The executable was created with PyInstaller. To rebuild it after changing the code:

```
cd C:\#_LUCRU\Aplicatii\ExportPortalUsers

# (once) install the tools
python -m pip install pyinstaller openpyxl pillow

# (optional) regenerate the icon
python make_icon.py

# build the exe
python -m PyInstaller --onefile --console \
    --name ExportPortalUsers \
    --icon app.ico --collect-all openpyxl \
    --distpath dist --workpath build --specpath build --noconfirm \
    export_portal_users.py
```

Troubleshooting

Symptom	Cause / fix
"Windows protected your PC" when starting the exe	SmartScreen false positive (unsigned exe). More info → Run anyway.
Antivirus flags the exe	Common false positive for unsigned PyInstaller executables.
Token request failed / authentication error	Wrong password/user, or the account cannot list the organization's members.
TLS certificate error (CERTIFICATE_VERIFY_FAILED)	Internal/self-signed certificate → set INSECURE_SSL = True.
python is not recognized	Python not installed / not in PATH. See python.org/downloads .
The password prompt does not appear / hangs	Run in a real terminal, not via a pipe; or use PORTAL_PASSWORD.
The Groups column is empty	Members really have no groups, or INCLUDE_GROUPS = False.

Technical notes

- The CSV file is written with UTF-8 with BOM encoding (utf-8-sig) for correct display of diacritics when opened directly in Excel.
- The Created, LastLogin, Modified values come from the portal as epoch-milliseconds and are converted to readable local time.
- The application does not depend on the arcgis library; it uses only the Python standard library + openpyxl (only for the .xlsx export).
